Routes towards New Physics

Standard Model \subset QFT = Quantum Mechanics + Special Relativity

Routes towards New Physics:

Beyond Standard Model, but still in QFT

SUSY, composite Higgs, dark sector, inflation, . . .

2 Beyond Special Relativity, but assuming QM

• QFT in curved spacetimes - 'semi-classical' (Unruh effect, ...)

$$S \mathrel{\mathop:}= C(x,y) + C(x,y') + C(x',y) - C(x',y')$$

Can we achieve S = 4?

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y')$$
, for all a, x, y, y' , $\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y)$, for all b, x, x', y ;

$$S \mathrel{\mathop:}= C(x,y) + C(x,y') + C(x',y) - C(x',y') \leq 4$$

Can we achieve S = 4?

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y')$$
, for all a, x, y, y' , $\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y)$, for all b, x, x', y ;

$$S \coloneqq C(x,y) + C(x,y') + C(x',y) - C(x',y') \leq 4$$

Can we achieve S = 4?

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y')$$
, for all a, x, y, y' , $\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y)$, for all b, x, x', y ;

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y')$$
, for all a, x, y, y' , $\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y)$, for all b, x, x', y ;

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y'), \text{ for all } a, x, y, y', \\\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y), \text{ for all } b, x, x', y ;$$

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y'), \text{ for all } a, x, y, y', \\\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y), \text{ for all } b, x, x', y ;$$

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y'), \text{ for all } a, x, y, y', \\\sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y), \text{ for all } b, x, x', y ;$$

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y'), \text{ for all } a, x, y, y', \\ \sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y), \text{ for all } b, x, x', y ;$$

$$S := C(x, y) + C(x, y') + C(x', y) - C(x', y') \le 4$$

Can we achieve S = 4? Obviously yes, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\sum_{b} P(a, b \mid x, y) = \sum_{b} P(a, b \mid x, y'), \text{ for all } a, x, y, y', \\ \sum_{a} P(a, b \mid x, y) = \sum_{a} P(a, b \mid x', y), \text{ for all } b, x, x', y ;$$

$$S := C(x,y) + C(x,y') + C(x',y) - C(x',y') \le 4 = S_{\mathsf{PR}} > S_{\mathsf{QM}} = 2\sqrt{2}$$

Can we achieve S = 4? **Obviously yes**, if

- Alice and Bob can communicate,
- or their settings are pre-correlated.

But can we do it assuming:

• no-signalling:
$$\begin{split} \sum_b P(a,b\,|\,x,y) &= \sum_b P(a,b\,|\,x,y'), \text{ for all } a,x,y,y', \\ \sum_a P(a,b\,|\,x,y) &= \sum_a P(a,b\,|\,x',y), \text{ for all } b,x,x',y ; \end{split}$$

Quantum state preparation:

- In principle, any quantum state can be prepared via proj. measurements.
- $\psi_{\rm in}$ is pure, uncorrelated with the box 'freedom of choice'.

Quantum state tomography:

- A mixed state ρ_{out} on \mathcal{H} is an $n \times n$ matrix, with $n = \dim \mathcal{H}$.
- Take a complete set of projectors $\{M_i\}_{i=1}^{n^2-1}$ (e.g. $\{\sigma_x, \sigma_y, \sigma_z\}$).
- Make multiple measurements and register $\{P(a_j \mid M_i)\}_{i,j}$
- The state ρ_{out} is estimated from $\operatorname{Tr}(M_i \rho_{\text{out}}) = \sum_j a_j P(a_j | M_i)$.

Beyond quantum mechanics in HEP
QM implies that any quantum channel, i.e. a map *E* : S(*H*_{in}) → S(*H*_{out}) is completely positive trace preserving (CPTP).

Kraus' theorem

For every CPTP map $\mathcal{E}: S(\mathcal{H}_{in}) \to S(\mathcal{H}_{out})$ there exists a (non-unique) set of operators $\{K_i\}_{i \leq mn}$, where $m = \dim \mathcal{H}_{in}, n = \dim \mathcal{H}_{out}$, such that

$$\mathcal{E}(\rho) = \sum_{i} K_i \rho K_i^{\dagger}$$
 and $\sum_{i} K_i^{\dagger} K_i = \mathrm{id.}$

Choi–Jamiołkowski isomorphism (aka channel–state duality)

 \mathcal{E} is CPTP if and only if $\widetilde{\mathcal{E}} = \frac{1}{m} \sum_{i,j=1}^{m} |i\rangle \langle j| \otimes \mathcal{E}(|i\rangle \langle j|) \in \mathbb{C}^{mn \times mn}$ is a state.

We can test QM by checking the CPTP property.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ● ●

- \mathcal{E} is completely characterised by $m^2(n^2-1)$ real parameters.
- \mathcal{E} can be reconstructed from a **Q-data test** $\{\psi_{in}^{(k)}; \rho_{out}^{(k)}\}_k$, for $k = 1, \dots, m^2$.
